TITLE: The Tasks of the All-Union Scientific Research Institute of Normalization in Machine Building (Zadachi Vsesoyuznogo nauchno-issledovatel'skogo instituta po normalizatsii v mashinostroyenii)

PERIODICAL: Standartizatsiya, 1958, Nr 6, pp 15-17 (USSR)

ABSTRACT: Mass production makes standardization of machine parts necessary. In the former ministry of apparatus manufacture more than 4,000 different cylindrical cog wheels were used in production. In 15 Leningrad machine building plants more than 600 types of springs are still used. In various sovnarkhozes there are 10 to 15 different systems of standard specifications. The All-Union Scientific Research Institute for Normalization in Machine Building (VNIINMASH) has been organized under the Committee of Standards, Measures and Measuring Devices, in order to develop state standards and instructions for their application. The work of all scientific and designing organiza-

TITLE: Decomposition of the Carbide Phase of White Cast Iron-Cementite Under the Action of Neutron Radiation

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 6, pp 1259-1262 (USSR)

ABSTRACT: The small number of papers written about phase conversions of metals and alloys under the action of neutron radiation is pointed out in the beginning (Refs 1-8). In order to study the above-mentioned process white cupola furnace-cast iron was used, from which cementite was extracted in form of a carbide sediment by electrolysis. The analysis of the initial material made under the management of N. M. Popova is given in table 1. Aluminum containers were placed for irradiation in the active zone of a nuclear reactor (concentrated uranium and ordinary water) with a total neutron flux of 10^{12} neutrons per $\text{cm}^2\text{.sec}$. The thermal neutrons were absorbed by an 1 mm thick Cd-filter. The amount of the flux of the 1 Mev fast neutrons was $1-5 \cdot 10^{10}$ neutrons per $\text{cm}^2\text{.sec}$, and therefore the

Card 1/3

Decomposition of the Carbide Phase of White Cast
Iron-Cementite Under the Action of Neutron Radiation

SOV/20-127-6-32/51

total dosage was $0.2\text{--}1 \cdot 10^{16}$ neutrons per cm^2 for 50 hours of irradiation. The irradiated and the non-irradiated cementite samples were examined by X-ray analysis (Ionisation apparatus type URS-50-I, Fe-K-radiation). The irradiated sample showed all lines of the cementite and the most intensive line of graphite (002) as well as lines of Fe_3O_4 (311) with low intensity.

After annealing there were no changes observed for the non-irradiated sample while remarkable phase conversions were indicated by the X-ray analysis of the irradiated sample (Fig 2). Table 2 and figure 1 show the phase conversion of Fe_3C dependent on the annealing temperature. The irradiated

cementite already deposits almost $2/3$ of its iron at only 650° . This decomposition of Fe_3C is caused by centers of crystallization formed by irradiation. α -iron crystallizes at annealing temperatures below the austenite range, and γ -iron at temperatures of the austenite range. Carbon crystallizes in graphite only at temperatures above 1000° . The irradiation dosage applied was insufficient to form adequately active

TITLE: The Influence of an Electron Irradiation Upon the Decomposition of Cementite and the Graphitization of White Cast Iron

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 4,
pp. 825-828

TEXT: The authors report here on attempts made to study the influence of electron irradiation on the graphitization of white cast iron and the decomposition of cementite, which represents a metastable phase of white cast iron. The structure of industrial cast iron samples consisted of cementite, ledeburite, and perlite. The temperature of the samples was measured with Pt-PtRh thermocouples, and the energy of the electrons was about 1.7 Mev. Fig. 3 shows the variation in hardness of irradiated and nonirradiated samples, annealed at 700°C, from which the effect of electron irradiation upon graphitization can be seen. Experiments made with irradiation of pure cementite prepared with the help of N. M. Popova, in vacuo at a temperature of 600 - 620°C, revealed that cementite is

the Decomposition of Cementite and the Graphitiza- B019/B060
tion of White Cast Iron

decomposed to form graphite. Fig. 4 shows an X-ray picture of irradiated cementite. From the fact that cementite irradiated by electrons is chiefly decomposed by their ionizing action, the authors draw the conclusion that iron and carbon atoms in the cementite lattice possess an ion bond. The authors believe that the same effects are bound to arise on a sufficiently strong γ -irradiation. The authors thank Professor Zhukhovitskiy for his discussion of the results. Ye. Ya. Rozinskiy is mentioned. There are 4 figures, 1 table, and 16 references: 11 Soviet, 1 British, 3 US, and 1 German.

The Effect of Nuclear Radiation (Cont.)

PURPOSE: This book is intended for personnel concerned with nuclear materials.

COVERAGE: This is a collection of papers presented at the Moscow Conference on the Effect of Nuclear Radiation on Materials, held December 6-10, 1960. The material reflects certain trends in the work being conducted in the Soviet scientific research organization. Some of the papers are devoted to the experimental study of the effect of neutron irradiation on reactor materials (steel, ferrous alloys, molybdenum, avial, graphite, and nichromes). Others deal with the theory of neutron irradiation effects (physico-chemical transformations, relaxation of internal stresses, internal friction) and changes in the structure and properties of various crystals. Special attention is given to the effect of intense γ -radiation on the electrical, magnetic, and optical properties of metals, dielectrics, and semiconductors.

AUTHOR: Shalashov, V. A.

TITLE: Concerning the influence of preliminary irradiation on the structure and thermal decay of cementite

SOURCE: Zhurnal fizicheskoy khimii, v. 38, no. 2, 1964, 485-488

TOPIC TAGS: cementite irradiation, cementite breakdown, cementite iron carbide, Compton effect, Fe C bond

ABSTRACT: This work was prompted by the general interest concerning the influence of preliminary irradiation on the decomposition of chemical compounds. The author concentrated his study on iron carbide (cementite) which was extracted from white cast iron. It had a content of 7.1% C, 0.39% Si, 0.51% Mn, and 0.19% Cr. The rest was iron. The irradiation of cementite with gamma quanta, causing interior beta-radiation (Compton effect) results in lowered intensity of reflections on radiograms, especially when combining radiation with heat treat-

TOPIC TAGS: white cast iron, cementite, cast iron neutron irradiation, cementite neutron irradiation, cast iron electron irradiation, cementite electron irradiation, cementite gamma irradiation

ABSTRACT: White cast iron containing about 45% cementite (Fe_3C) and pure cementite electrolytically precipitated from white cast iron were irradiated with a neutron flux of $10^{12} n/cm^2 \cdot sec$, fast electrons, and gamma rays and vacuum annealed at a temperature varying from 650—1050C. The neutron irradiation dose for cementite and cast iron was $0.2-5 \times 10^{16} n/cm^2$ and the irradiation temperature did not exceed 65C. Prolonged high-temperature annealing produced no structural changes in unirradiated cementite, but in irradiated cementite, annealing at lower temperatures for a shorter time resulted in a phase transformation. For example, annealing for 2 hours at 650C, i.e., below the austenitic transformation temperature, led to an

nerette hole drilling, laser hole drilling, laser / OKh23N28M3D3T steel

ABSTRACT: The Scientific Research Institute of Light Textile Machinery
has investigated the possibility of using lasers in making holes in
filament-drawing spinnerettes. A ruby laser with a 0.7 j maximum
radiation energy was used for making holes in OKh23N28M3D3T steel
spinnerettes. It was found possible to make holes of almost cylindrical
shape and with a conical entrance if desired. The hardness of the
heat-affected zone did not undergo any substantial changes. Finished
experimental spinnerettes with up to 40 holes were tested at the
Kalinin Synthetic Fiber Plant, which found that the quality of filament

TITLE: Measurement of the slowing down length of neutrons from a Po-Be source in
graphite-water lattices

SOURCE: Atomnaya energiya, v. 18, no. 3, 1965, 282-284

TOPIC TAGS: neutron moderation, slowing down length, graphite water lattice,
heterogeneous reactor system

ABSTRACT: The slowing down lengths of neutrons from a Po-Be source to the energy
of resonance absorption of indium (1.46 eV) were measured in graphite-water hetero-
geneous systems parallel and perpendicular to the cylinder axis in the presence of
a graphite lattice, and also in ordinary water. The distribution of the slowed-
down neutrons was measured with indium indicator discs 0.1 mm thick and 10 or 39.5
mm in diameter. The activity was measured by a procedure, proposed by A. I.
Mogil'ner, which made it possible to avoid calculations connected with corrections
for radioactive decay. The test procedures and the calculations are described.

Card 1/2

ACCESSION NR: AP5009125

The slowing down length was calculated in the age approximation in accordance with a procedure proposed by V. P. Kochergin and V. V. Orlov (Atomnaya energiya v. 6, 34, 1959). The measured results for pure water were approximately 18% lower than calculated. Various causes of the discrepancies are discussed. "In conclusion the author thanks G. Ya. Aryukhov for valuable advice and hints." Orig. art. has: 1 figure, 2 formulas, and 1 table.

TITLE: Wind field and tangential stress of wind in the equatorial region of the Atlantic Ocean

SOURCE: AN UkrSSR. Morskoy gidrofizicheskiy institut. Trudy, v. 34, 1966. Techeniye Lomonosova (Lomonosov Current), 141-153

TOPIC TAGS: wind velocity, anticyclone

ABSTRACT: The general character of the wind field and tangential stress in the equatorial region of the Atlantic Ocean in winter and summer is studied by the use of ship observations, which are averaged by gradients of 1° width and 5° length. The tangential stress of the wind, τ , calculated by the formula $\tau = cpW^2$; the components τ_x and τ_y are calculated similarly: $\tau_x = cpWW_x$, $\tau_y = cpWW_y$. The region is characterized by an area of reduced pressure and the equatorial hollow found between two stationary subtropical anticyclones, on whose peripheries zones of trade winds are found. The equatorial hollow, the low pressure centers on the Brazilian and African coasts, and the zones of trade winds shift to the north in the summer. In the winter, minimum val-

Card 1/2

ACC NR: AT6032068

ues of τ (less than 0.25-0.5 dynes/cm²) and τ_x (less than 0.25 dynes/cm²) are found in the equatorial hollow. Maximum values of τ (1.0-2.5 dynes/cm²), τ_x (2.0 dynes/cm²), and τ_y (1.5 dynes/cm²) are found in the zone of the southeast trade winds. Intermediate values of τ (0.5 to 1.5, increasing east to west) are found in the zone of the northeast trade winds. In general, τ , τ_x , and τ_y show much less variation than in summer. In the summer, the most notable feature is a narrow strip of weak winds lying along the equator. Minimum values of τ (less than 0.25 dynes/cm²), τ_x , and τ_y are located in this strip. Minimum values of τ_x are also found in a low pressure center, 5° to 9° N. In the zone of the southeast trade winds, τ increases from 1.0 dynes/cm² in the east to 2.5 dynes/cm² in the west; maximum values of τ_x , greater than 3.0 dynes/cm², are also found here. The variation of τ_y is much larger than in winter, the values ranging from less than 0.25 dynes/cm² to greater than 2.0 dynes/cm². The direction of τ_x and τ_y is similar for both seasons. τ_x is directed to the east along the African coast and to the west elsewhere; τ_y is directed to the south, north of the axis of the equatorial hollow, and to the north, south of it. there are individual zones of westerly components of transfer of air masses which persist a short time and are situated near the principal regions of westerly flow. In the tropical Atlantic, as in the Pacific, there therefore is a stratification of zonal flows in the troposphere and lower stratosphere with a dominance of a three- or two-layered system. In the lower troposphere there usually is a dominance of easterly transfer of air masses. In the middle and upper troposphere there sometimes is a continuous layer with westerly components connecting the westerly flows of the two hemispheres. It is probable that as in other equatorial regions there is a two-year periodicity in alternation of westerly and easterly flow in the lower stratosphere.

TITLE:

On the Synthesis of the β -(2-thienyl) Alanine (O sinteze β -(2-thienyl) alanina)

PERIODICAL:

Izvestiya AN SSSR, Otdeleniye Khimicheskikh Nauk, 1958
Nr 1, pp. 98 - 100 (USSR)

ABSTRACT:

The data published of late prove that β -(2-tienyl) alanine has an extensive biological activity. In connection here with a series of papers was published which dealt with the synthesis of the β -(2-tienyl) alanine. Crowe and Nord (reference 4) obtained this aminoacid by exploiting the reaction of the 2-thiophenalddehyde with rodanine. However, the experimental results of the synthesis which was based only on the use of rodanine were less satisfactory. For this reason it seemed expedient to the authors of this paper to investigate the possibility of the synthesis of the β -(2-tienyl) alanine according to the method of Sasaki. The experiments carried out by the authors showed that the method of the synthesis of β -(2-tienyl) alanine with the aid of diketopiperazine is comparatively simple: in any case it is more useful than the hitherto published methods. There are 8 references.

The Synthesis of Amino Acids of the Aliphatic Series From Thiophene Derivatives (Sintez aminokislot alifaticheskogo ryada iz proizvodnykh tiofena) II. The Synthesis of β -Amino Acids (II. Sintez β -Aminokislot)

PERIODICAL: Zhurnal Obshchey Khimii, 1950, Vol 28, Nr 1, pp.213-222(USSR)

ABSTRACT:

In recent years new data were published in periodicals on the investigation of β -amino acids, as biologically active compounds, of whom earlier little notice had been taken. Thiophene as initial product (references 4 and 5) began to play an important part. The way from thiophene and its homologues to amino acids is illustrated by the formulae (I), (II) and (III). The second stage of this process consists of the condensation of the aldehyde, which can easily be produced, with malonic acid and ammonia to β -amino acid according to V. M. Rodionov. The final stage is brought about by the reducing desulphurization with the aid of nickel. The

The Synthesis of Amino Acids of the Aliphatic Series From Thiophene Derivatives. II. The Synthesis of β -Amino Acids

Given synthesis of β -amino acids contains all possibilities which were characterized by the authors in papers devoted to the methods of synthesis of amino acids of another type. From the above-mentioned scheme follows that the acid of a ramified structure must form when ever the substituent or the aldehyde group are in positions 3 and 4, or when the substituent in position 5 has a ramified structure. Thus the following compounds were obtained from the corresponding 2-thiophene-aldehydes according to Rodionov's method: β -(2-thienyl)- β -aminopropionic-, β -(5-propionic-, β -(5-methyl-2-thienyl)- β -aminopropionic and β -(5-tert-butyl-2-ethyl-2-thienyl)- β -aminopropionic acid. By the hydrogenolysis of these amino acids of the thiophene series the authors synthesized β -amino-n-heptyl-, β -amino-n-capronic, β -amino-n-pelargonic acid. By hydrogenolysis of the acetyl derivatives of β -(5-ethyl-2-thienyl)- β -aminopropionic and β -(5-tert-butyl-2-thienyl)- β -aminopropionic acid the acetyl derivatives of β -amino-n-pelargonic and θ , θ -dimethyl-amino-n-pelargonic acid respectively are obtained. By saponification of the acetyl derivative of θ , θ -dimethyl- β -aminopelargonic acid

with hydrochloric acid the hydrochloride of α, β -dimethyl- β -aminopropionic acid was obtained; by neutralization free amino acid was liberated. There are 19 references, 10 of which are Slavic.

(USSR)

ABSTRACT:

There are comparatively little data available on the highest aliphatic amino acids of the structure $RCH(NH_2)(CH_2)_nCOOH$, where R = alkyl, although they are interesting as polycondensation objects (Ref 1) or as derivatives for physiological investigations (Ref 2). Their general method of synthesis is so far unknown; for the synthesis of some of these amino acids natural products were used; thus, for instance, the 10-amino-undecanic acid (Refs 1,2) was obtained from

undecylenic acid which is formed on the pyrogenetic cleavage of castor oil. The method previously suggested by the authors which is based on the reductive desulfurization (hydrogenolysis) of the oximino and amino acids of the thiophene series (Refs 3-8) yields aliphatic amino acids of any kind. The thiophene-keto acids previously used by the authors permit only the synthesis of such amino acids in which the carbon atom, as carrier of the amino group, is combined with an alkyl which contains not less than 4 carbons. This restriction was partly removed with the oximes of the aldehyde acids as initial products (Ref 8). In the present paper the synthesis of the highest amino acids of the mentioned type from the oximes of the keto acid (II) according to the given scheme is described. In this way the highest aliphatic amino acids can be synthesized which have the amino group in the required position to the carboxyl and an alkyl radical at the carbon atom combined with the amino group, with the necessary number of carbon atoms. The experimental part gives details on the carrying out of the reaction scheme mentioned. By the

TITLE:

Reductive Acetylation of Thiophene Series Nitrocompounds in the
Presence of Skeleton Nickel (Vosstanovitel'noye atsetilirovaniye
nitrosoyedineniy ryada tiofena v prisutsvii skeletnogo nikelya)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 1, pp 86 - 89

ABSTRACT:

The first and the third author proved earlier (Ref 1) that γ -amino-valeric acid is produced with a small yield by the effect of skeleton nickel (Ni_{sk}) on the 5-nitro-2-thiophene-carboxylic acid (I). On the strength of reference 2 the authors tried to increase this yield by the application of acetic acid anhydride as medium. However, they succeeded only in isolating the acetyl-amino acid (II) from the reaction mixture. The recognition that this acid produces (III) in the case of the effect of Ni_{sk} in the aqueous medium (Ref 3) led to the conclusion that the acetic acid anhydride deactivates Ni_{sk} . This conclusion was confirmed in the case of two other examples. Thus the react-

compounds in the Presence of Skeleton Nickel

SOV/20-126-1-23/62

ion of Ni_{sk} with thiophene-nitroderivatives remains under the mentioned conditions in the production stage of an acetyl-amino compound. That is to say, the result of the process is a reductive acetylation. Although the effect of the solvent upon the reducing properties of Ni_{sk} in the case of the hydrogenation of the thiophene derivatives has already been published (Ref 4) the authors could not find data concerning the capacity of the acetic acid of suppressing the desulfurizing function of Ni_{sk} in such cases. The authors found contradictions in the publications concerning the properties of the 5-acetyl-amino-2-thiophene-carboxylic acid (II) (Refs 6-11) when they identified the latter. Since the melting point $230\text{--}232^{\circ}$ of the acetyl-amino acid (with a II-structure as is assumed) produced by the authors did not agree with that of the publications (272°) they determined the position of the acetyl-amino group in the nucleus. Thus the structure II was confirmed. On the strength of these data the authors doubted whether the experi-

compounds in the Presence of Skeleton Nickel

SOV/20-126-1-23/62

mental results of reference 8 were right. The authors then repeated the experiment of reference 8 and obtained acid potassium tartarate with a melting point 273-274°. The authors assume that Campaigne and Archer (Ref 8) erroneously regarded this acid salt as the acetyl-amino acid (II). There are 18 references, 3 of which are Soviet.

TITLE: Polymerization of C-ethyl and C-propyl substituted
enantholactams

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 12, 1962,
1829-1832

TEXT: The susceptibility of γ -ethyl- γ -enantholactam and of β -n-propyl- γ -enantholactam to polymerization was investigated. Synthesis: The lactam of δ -(3-aminothienyl-2)-valeric acid, or the lactam of δ -(3-amino-5-methylthienyl-2)-valeric acid was obtained from 2',3'-thiopheno-1,2-cycloheptan-3-one oxime or from 5'-methyl-2',3'-thiopheno-1,2-cycloheptan-3-one oxime by Beckmann rearrangement in the presence of benzene sulfochloride. At the same time the sulfur was eliminated with skeleton nickel, and the double bonds of the thiophene ring were hydrogenated. The polymerization was carried out at 220-280°C with 2% H₂O as catalyst in N₂ atmosphere.

Solid, glass-like substances with m.p. 170°C were obtained, which can be

Polymerization of C-ethyl and...

pulled out to filaments at 175°C and from the hot alcoholic solution of which films can be formed. The polymer yield was more than 99%, the intrinsic viscosity reached 0.50 for the ethyl derivative, and 0.30 for the propyl derivative. Conclusion: In contrast to the seven-membered caprolactam ring, the polymerization susceptibility of the eight-membered enantholactam ring is not affected by substituents.. There is 1 figure.
